PATENTS AND INTELLECTUAL PROPERTY RIGHTS:

Provisional Patent #61/084,662 *Viewing Window* paradigm to assess visuomotor functioning. An experimental and diagnostic tool for use in identifying conditions that affect parietal lobe and/or visuomotor integration such as: Alzheimer's disease, stroke, Parkinson's, hemispatial neglect, optic ataxia, and natural aging. Differing from other diagnostic tests, this tool requires little verbal instruction and directly assesses a patient's ability to combine visual and motor information. The viewing window provides a quick and informative way of determining performance deficits that are often difficult to detect using standard bedside testing apparatus. Further, the viewing window is a comparatively inexpensive technology, requiring few specialized pieces of equipment.
